Experiment 7: Cellular System Performance Dashboard Using Figma

1. AIM

To design a dashboard prototype in Figma to monitor cellular system performance criteria such as network availability, call success rate, signal strength, latency and data throughput.

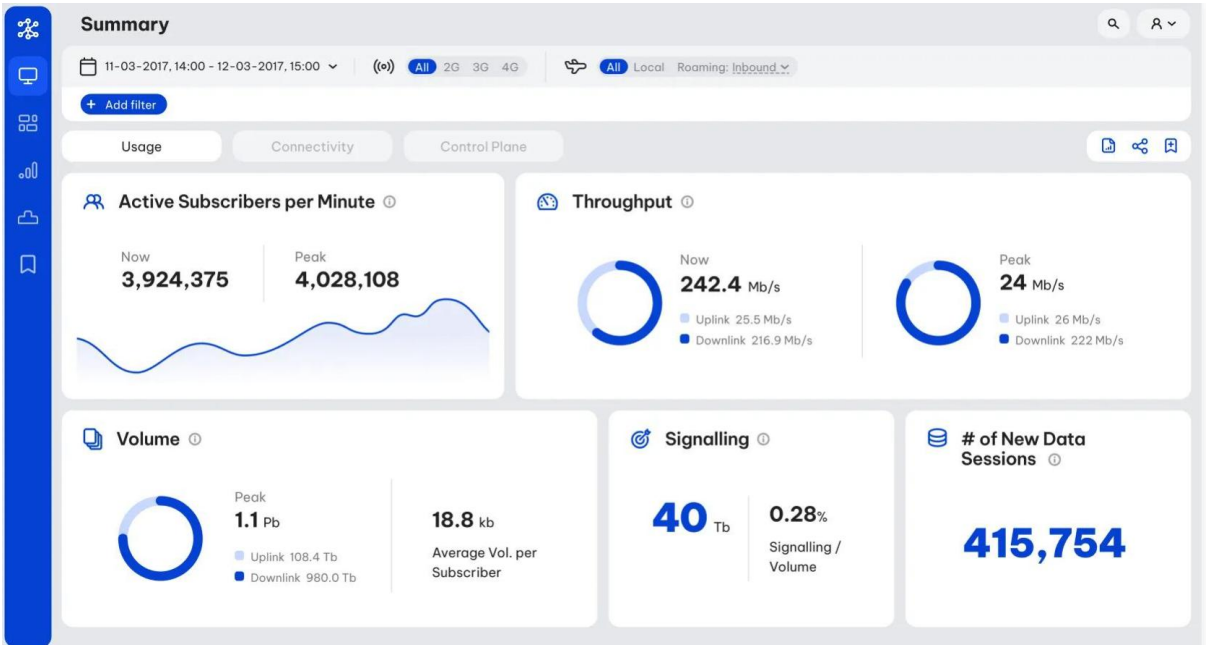

2. SOFTWARE USED

- Figma
- Figma AI (Make Design)
- Web Browser

3. PROCEDURE

1. Open Figma and select Make Design.
2. Create a new desktop dashboard frame (1440 × 1024).
3. Add a sidebar with Dashboard, Network Status, Performance, Analytics and Settings.
4. Create performance cards for network availability, call success rate, call drop rate and signal strength.
5. Add line charts, bar charts and progress indicators.
6. Include network status and alerts sections.
7. Apply suitable colours, icons and fonts.
8. Connect navigation elements using prototype interactions.
9. Preview the dashboard using Present mode.

4. PROTOTYPE DESIGN

Main components:

- Network performance overview
- Performance monitoring cards
- Signal strength graph
- Network traffic analysis
- Network status indicators
- Alerts and notifications

5. RESULT

Thus, a cellular system performance dashboard prototype was successfully designed in Figma to monitor and visualize important network performance criteria using charts, metric cards and interactive navigation.
