Aim:

To design and simulate a mobile network handoff process using Figma, showing how a mobile device transfers its connection from one cell tower to another without interrupting communication.

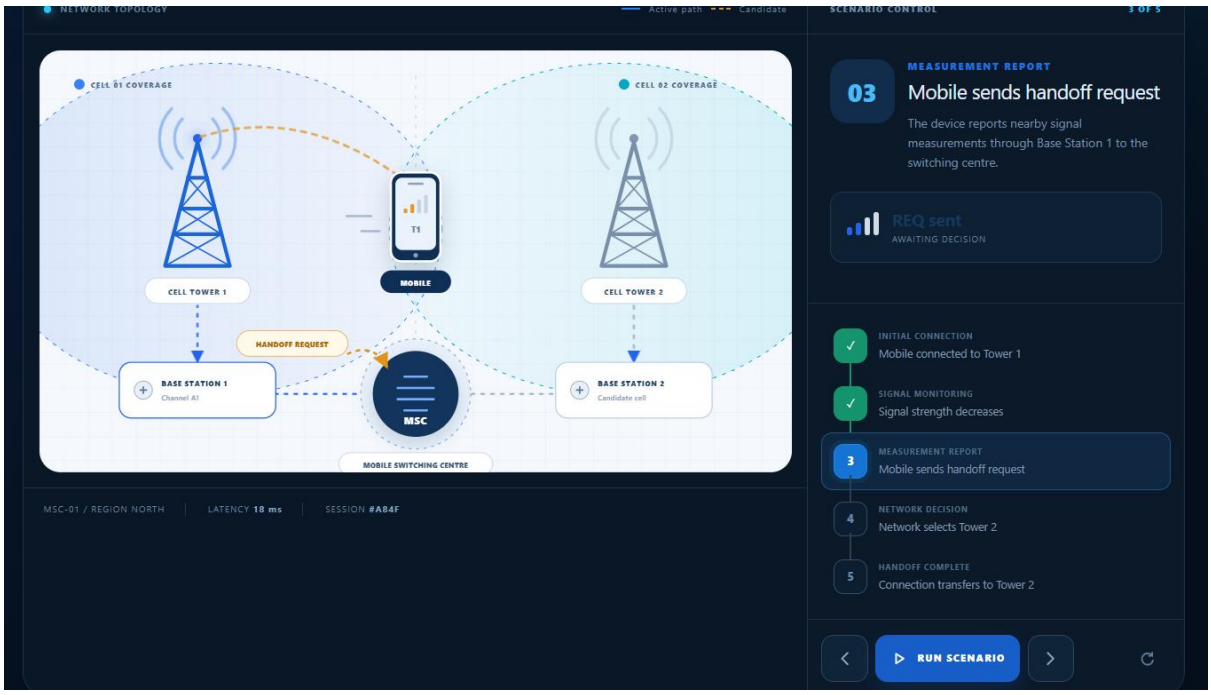

Software Used:

- Figma

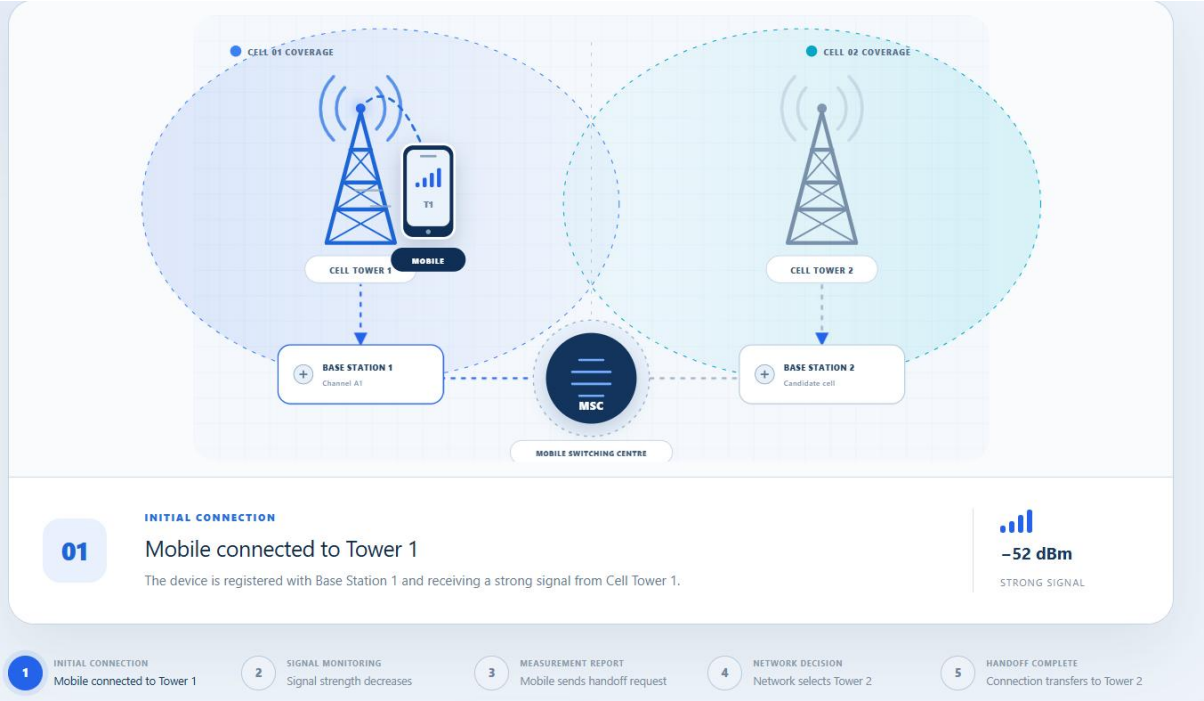

Algorithm:

1. Start the mobile device connected to the first cell tower.
2. Move the mobile device towards the second cell tower.
3. Monitor the signal strength of both towers.
4. When the second tower provides a stronger signal, initiate handoff.
5. Transfer the connection to the second tower and maintain communication.

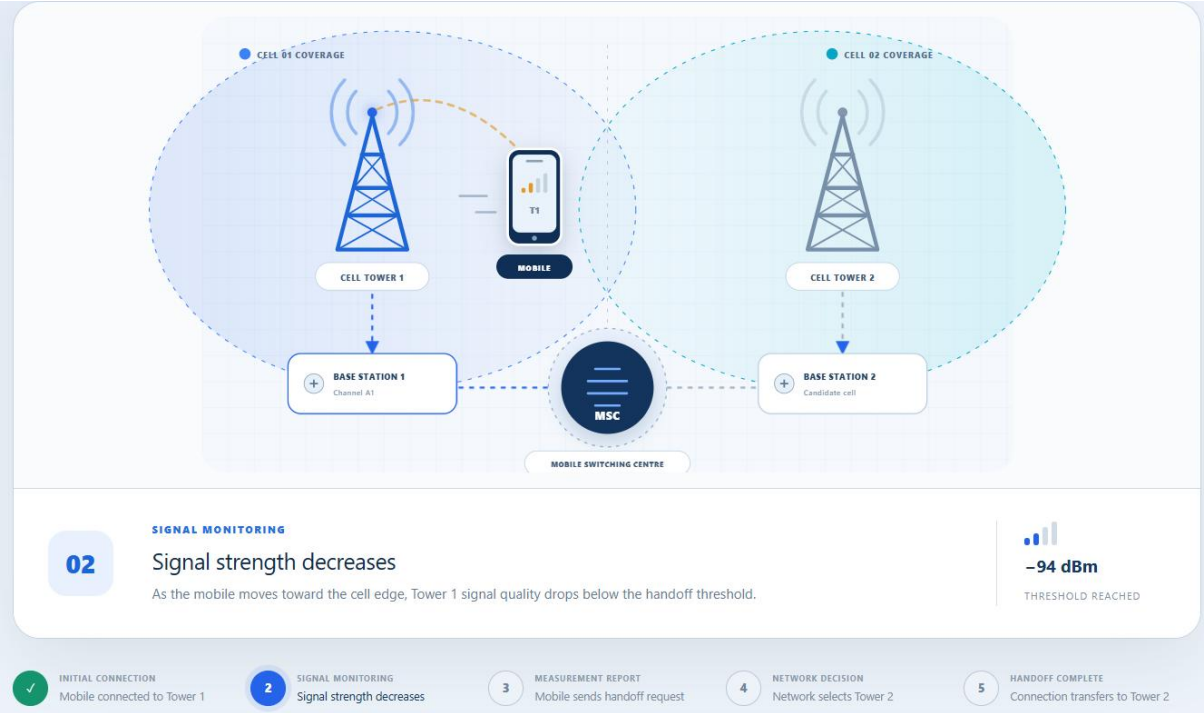

Prototype:

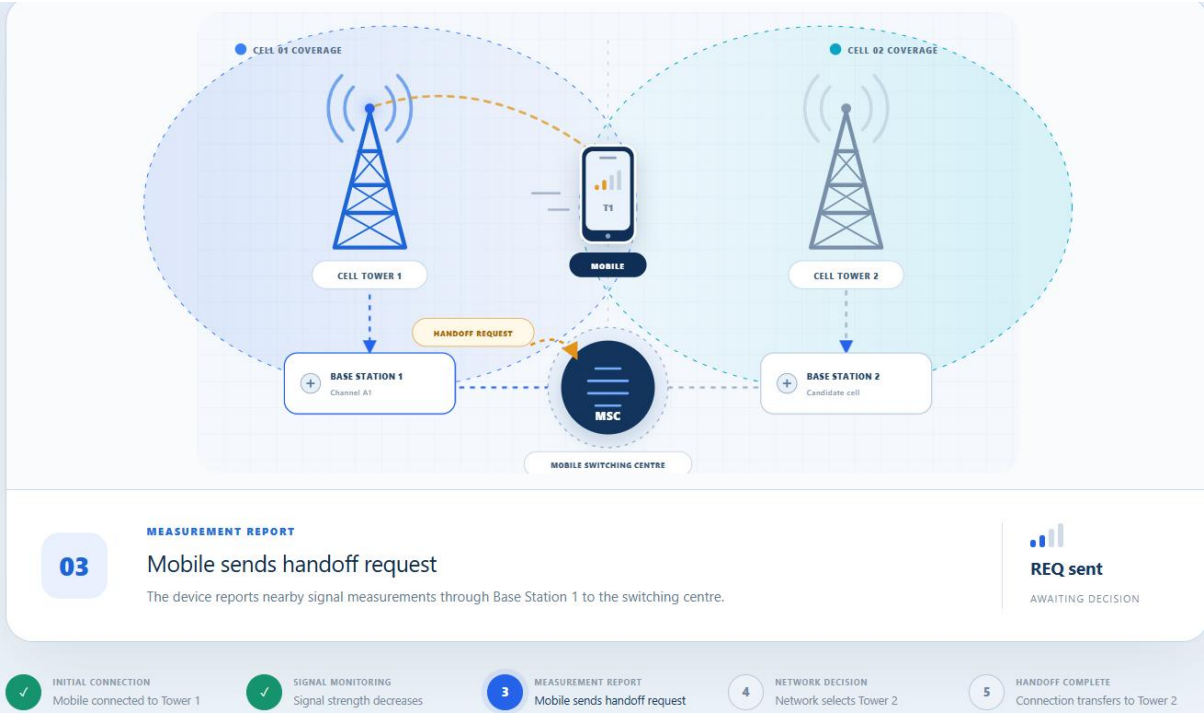

Initial Connection – Mobile connected to Cell Tower

Signal Monitoring – Monitoring signal strength and detecting signal decrease.

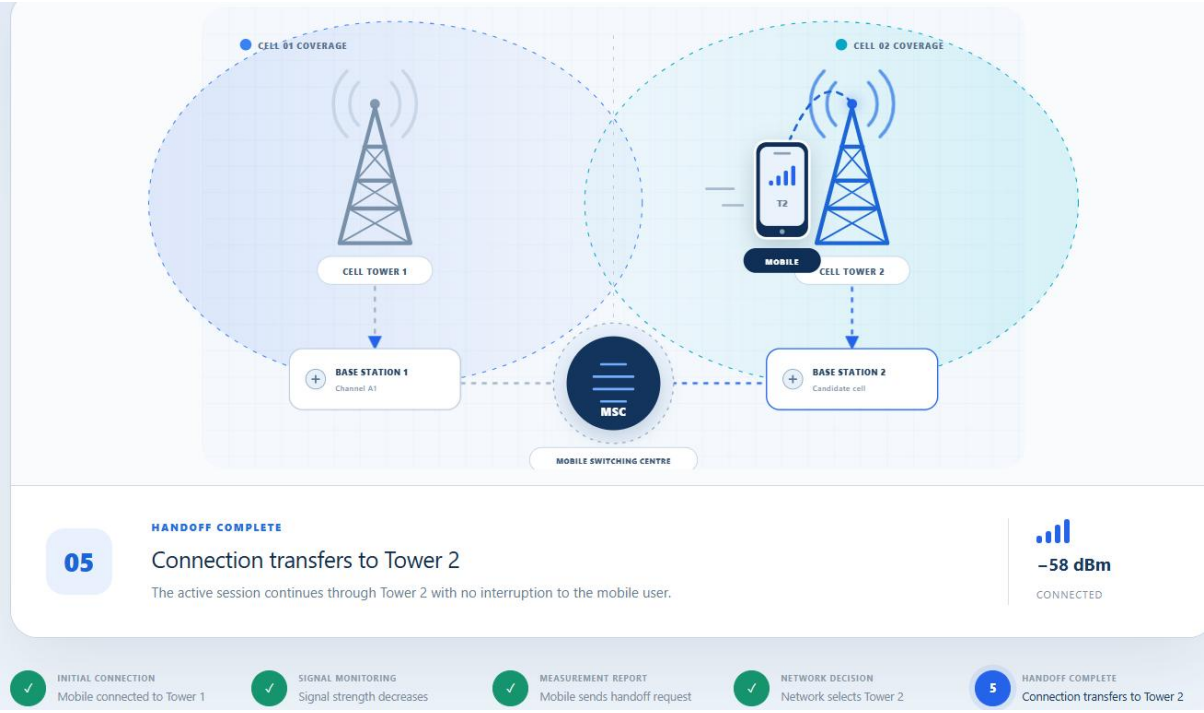

Handoff Request – Mobile sends a handoff request to the network.

Network Decision – Network selects the best available Cell Tower 2.

Handoff Complete – Connection successfully transfers to Cell Tower 2.

Design :

RESULT: Successfully designed and simulated a mobile network handoff scenario using Figma, demonstrating seamless connection transfer between two cell towers without call interruption.
